

BEGINNER'S GUIDE

Accounts & API Keys Setup — Kodexo Voice Agent

Companion to KL-FSD-VOICE-006 and KL-PP-VOICE-003 (Phase 1: Prerequisites & Account Setup)

Version 1.0 — Draft

How to Use This Guide

Each section below covers one account or API key this project needs, in the order you'll likely set them up. For every one, you'll find: what it's for in plain English, whether the FSD says it already exists (so you should ask for access instead of signing up fresh), where to go, the exact steps to get the key, where that key gets used later in the build, and roughly what it costs.

A general rule for every key below: copy it into a password manager or a project secrets file the moment it's generated. Most providers only show the full key once — if you lose it, you'll have to delete it and generate a new one. Never paste an API key into a chat message, an email, or a public code repository.

1. Twilio (phone number + SIP trunk)

Twilio is the phone company piece — it owns the actual phone number callers dial and hands the call off to LiveKit. You need an Account SID, an Auth Token, a phone number, and a SIP Trunk.

Per the FSD, an account already exists — ask whoever manages billing/telephony for access before creating a new one.

Sign up / log in here

twilio.com — click "Sign up" (or ask for an invite to the existing account).

Steps to get the key/credentials

1. Create an account (or get added to the existing one) and verify your email and phone number.
2. In the Twilio Console (the dashboard you land on after login), copy the Account SID and Auth Token shown on the main dashboard page — treat these like a password.
3. Buy a phone number: Console → Phone Numbers → Buy a Number → pick a local or toll-free number.
4. Create a SIP Trunk: Console → Elastic SIP Trunking → Trunks → Create new Trunking — this is what routes calls to LiveKit. The developer setting up LiveKit will give you the SIP endpoint address to enter here.

Where it gets used in this project

The Account SID/Auth Token let backend code manage the number and trunk; the SIP Trunk is the actual bridge that hands live calls to the LiveKit server.

Cost

A phone number is a few dollars a month; calls are billed per minute. No cost until a number is purchased.

3. LiveKit (self-hosted — no vendor account needed)

LiveKit itself is free, open-source software installed on your own server (item 2 above) — there's no sign-up here, but it does generate its own API key and secret that the agent worker uses to talk to it.

New — installed as part of the build, not a separate account.

Sign up / log in here

docs.livekit.io — reference documentation for installation (no login required to read it).

Steps to get the key/credentials

1. The developer installs LiveKit server on the VPS from item 2.
2. During setup, LiveKit generates its own API key and API secret — these are created locally, not requested from a website.

3. These are saved securely alongside the other keys in this document (e.g. in the project's password manager or secrets file) — never in code that gets shared or committed.

Where it gets used in this project

The agent worker uses this key/secret pair to connect to the LiveKit server and join call rooms.

Cost

Free — the only cost is the server it runs on (item 2).

4. DeepSeek (Not recommended because it's slow, will use openai or gemini-realtime)

DeepSeek is the AI model that actually understands the caller and decides what the agent should say — this is the "brain" behind the conversation.

Per the FSD, a key already exists — Please provide it that as well..

1. Supabase (the database)

I will need the complete account credentials, or tell me if we are using ai-automation@gmail.com account for this

6. Deepgram (speech-to-text)

Deepgram converts the caller's spoken words into text.

Will need this account credentials as well.

7. Cartesia or ElevenLabs (ElevenLabs-Recommended)

Provide me the voice id, or complete account if I have to find it from the dashboard.

8. Slack (KL-bot notifications channel)

Slack Webhook to post updates in channel, or slack account I need to do the setup
